

Asset Performance & Tactical Attribution Framework : A Manchester United Case Study

Matches | Manager | Players

Methodology & Data Pipeline

Strategic Objectives

› Player Insights:

Benchmarking efficiency (Per 90) and identifying production gaps in the rotation.

› Manager Insights:

Comparison of tactical shifts and result volatility between managerial tenures.

› Match Insights:

Scrutinizing opposition groups, physical Intensity, home vs away and team resilience.

Relational Data Model

Normalized database architecture hosted on Google Sheets, utilizing four integrated tables: **Players**, **Player_match_stats**, **Team_match_stats** and **Lineup**

Technical Execution

- › Use of SQL for multi-table joins, data cleaning, and complex aggregations (xG/xA deltas and per 90 normalization)
- › Translated raw SQL query outputs into polished charts and visuals, resulting in a data-driven slide deck design.

Executive Summary

+6.96

xG EFFICIENCY (CARRICK)

Leadership Pivot

Carrick delivered a **71% win rate** by prioritizing defensive integrity. He successfully halved opponent crossing volume (down to 20.06/game) and forced 26% more backward passes, creating a "shutdown" model Amorim lacked (-0.70 xG rating).

110.3

KM WORK-RATE THRESHOLD

Possession Paradox

Tactical success is dictated by physical intensity, not ball dominance. The squad achieved an **80% win rate when outrunning opponents**. Home wins were optimized at a lean 47.1% possession, whereas high-volume possession (>60%) acted as a passive tactical trap.

0.66

SESKO PER-90 OUTPUT

Asset ROI & Production Gaps

Fernandes remains the engine with 30 contributions. Efficiency is led by Sesko (0.66/90) and Dorgu (0.50/90). This highlights a major gap in Amad, who yielded just 0.19/90 despite a massive 2,500-minute investment.

Team Overview

How has the team performed?

FAST FACTS

- Elite against the Top 6 with a 82% win rate but a miserable 18% against the Bottom 6.
- Away form remains incredibly shaky, with the squad dropping points in 12 out of 19 matches on the road.
- Opposition teams are crushed under Carrick, who halved their crossing volume and restricted them to just 1.0 goal per game.

Goal Contributions by Position

- + **Optional Threat:** Attack (54) and Midfield (47) both offer offensive options ensuring the opposition are kept guessing where the next danger is coming from.
- **Defensive Mediocrity:** The defense only contributes 11 goals (12%) which reflects the premier league average.
- **Tactical Action:** Increase scoring threat from defenders at set-pieces and overlapping fullbacks to achieve elite-level balance.

Opposition Groups

Win %

Possession %

GD

Distance Covered (Km)

Does Physical Intensity Drive Success?

Physical Benchmark: An operational baseline of more than 110km of aggregate team distance serves as a statistical predictor for securing 3 points.

Close-Outs: The minor physical drop-off in Draws (108.41km) suggests that sub-elite physical output directly compromises our ability to close out competitive matches, whereas Losses (108.74km) are likely driven by tactical variances rather than a drop in physical work-rate.

HOME VS AWAY

Super Counter:

Peak performances, are defined by low possession combined with maximum physical distance covered.

Possession Trap:

Whether Home or Away our productivity plummets in matches with heavy possession.

Action

Must transition from a passive, counter-attacking team into an active breaking-down unit, specifically at home. Training must immediately pivot to breaking deep defensive blocks by anchoring wingers to the touchline to stretch the opponent horizontally, combined with rapid, third-man vertical runs to penetrate central spaces before the defense can shift.

Tactical Resilience

Performance Outcomes When Trailing at Half-Time

W

2

D

1

L

5

While a 62.5% loss rate is the statistical majority, the core insight lies in the 37.5% Unbeaten Rate from a losing position. Securing 7 points (2 Wins, 1 Draw) out of a possible 24 from a trailing state demonstrates robust psychological resilience and highly effective half-time interventions by the management team.

Amorim VS Carrick: Performance

Ruben Amorim

Amorim prioritized defensive organization and strict tactical structure, resulting in a low win rate and passive draws.

Michael Carrick

Carrick adapts a fluid, direct model, prioritizing immediate results over structural dogmatism, leading to a brilliant win rate.

xG Efficiency

Carrick's tenure is spearheaded by exquisite finishing efficiency. Conversely, Amorim's squad suffered from underperformance.

Amorim VS Carrick: Key Opposition Metrics (pg)

Flank Lockdown -

Under Carrick, opponents cross 50% less and win significantly fewer aerial duels. Carrick's system effectively locks down the wide areas, forcing opponents out of their preferred attacking channels.

Dictating the Press -

Opponents are forced into 77 backward passes per game against Carrick compared to just 61 under Amorim. Our aggressive pressing actively forces the opposition away from our goal, directly resulting in dropping our conceded goals from 1.5 down to a sturdy 1 per game.

Player Overview

Which players are shining?

FAST FACTS

- Fernandes is the undisputed star man driving the attack with 30 goal contributions and 10 more assists than expected.
- Amad represents the biggest flop in the attacking rotation securing only 5 contributions compared to an expected 10.
- Heaven is the breakout star in defence having clocked in a squad high of 8.19 defensive actions per 90.

Offensive Output: The Minutes Audit

Contributions vs Minutes

n=101

Contributions per 90

Fernandes Raises The Standard: While Fernandes (30 contributions) leads the way, Sesko (0.66/90) and Dorgu (0.5/90) have sharp per 90 stats, suggesting they are undervalued assets and require more game time.

Tactical Outlier: Casemiro (0.38/90) provides elite offensive threat from deep, rivaling primary attackers like Cunha.

Production Gap: Amad is the primary underperformer; his 0.19/90 output is the lowest in the rotation despite logging nearly 2,500 minutes, indicating a poor season. His minutes should be monitored closely next season.

Defensive Output: The Minutes Audit

Contributions vs Minutes

n = 1441

Contributions per 90

Elite Starters: Shaw, Casemiro and Maguire, consistently outperform baseline defensive expectations over high minutes, while Fernandes adds highly valuable defensive bonuses for an advanced playmaker.

The Structural Flaw: Mainoo sits significantly below the trendline as a defensive outlier, proving he lacks the natural volume to play as a lone defensive anchor without a dedicated destroyer.

Super Heaven: Heaven is the primary achiever; his 8.19/90 output is the highest in the rotation and his high passing accuracy implies he will be a future starter for many years to come.

Finishing Mechanics: The xG Audit

Above xG: (Efficiency)

Goals vs xG: (Volume)

High Efficiency:
Almost 4 of the top 5 goalscorers (led by Casemiro) exceed xG, showing clinical finishing.

Amad the Outlier: Amad's -3.36 xG deficit shows he's squandering chances. Fernandes' low efficiency rating is due to missed penalties.

Tactical Action: Prioritise starting Sesko and Cunha; replace Amad with Dorgu.

Playmaking Mechanics: The xA Audit

Above xA: (Efficiency)

Assists vs xA: (Volume)

- + Fantastic Fernandes:** Bruno operates with telepathic chemistry with his forwards.
- Unlucky Duo:** Amad and Mbeumo created roughly 2 extra goals worth of high-value chances that their teammates wasted.
- > Tactical Action:** Prepare for a drop in performance from Bruno by shifting more playmaking responsibility to the wings

Shooting Profiles

● **'The Efficient':** Low Shots, High conversion
 ➔ Need to increase shot count or minutes to maximize potential.

● **'The Inefficient':** Low Shots, Low conversion
 ➔ Suggests finishing is weak.

● **'The Snipers':** High Shots, High conversion
 ➔ Elite finishers

● **'The Wasteful':** High Shots, Low conversion
 ➔ Improvement in finishing is needed.

Squad Efficiencies

FAST FACTS

- Heaven (91%), Mainoo (90%) and Amad (88%) lead their positions pass accuracy.
- Sesko is a force in the air, winning over 50% of his Aerial duels
- Only three players in the squad deliver goal contributions off the bench.

Passing Accuracy: Defense

Pass Accuracy % vs Total Passes

+ Lovely Left: Heaven and Shaw operate extremely efficiently with safe progression down the left of defence.

— Shaky Right: Mazraoui and Yoro have the lowest accuracy in the squad. When they play together it becomes a pressing trigger for opponents.

> Tactical Action: Alter tactical setup to give Mazraoui and Yoro safer passing outlets to shield their low accuracy. Additionally, integrate Heaven into more matches next season.

Passing Accuracy: Midfield

Pass Accuracy % vs Total Passes

Mainoo the Magnet:

Mainoo is a world-class press-resistant phenom. His near-90% accuracy ensures the team can safely build out of the back against any opponent.

Careless Casemiro:

Casemiro turning the ball over at an 18.5% clip in deeper midfield zones leaves the defense completely exposed to fast breaks.

Tactical Action:

Pair Mainoo with a high passing accuracy midfielder to take critical control of games where possession is key.

Passing Accuracy: Attack

Pass Accuracy % vs Total Passes

+ **Amad Mr Reliable:** A 87.37% passing accuracy means Amad almost never gives the ball away in the final third.

— **Striker Failure:** Sesko and Zirkzee are poor at holding the ball up leading to preventable turnovers.

➤ **Tactical Action:** Utilise Amad during games where possession is critical next season to maximize ball retention; Ensure Sesko works on his buildup during pre-season.

Dribbling Efficiency

+ Elite Ball-Carriers: Cunha and Amad spearhead the team's progressive carrying, successfully completing 1.50+ dribbles per 90 minutes.

+ Press-Resistant Anchors: Mainoo, Martinez, and Heaven showcase world-class security when stepping up from deeper zones.

— Low Efficiency Risks: Mbeumo and Dorgu attempt a high volume of dribbles but turn the ball over far too often. Dorgu has an alarmingly low 23.4% success rate.

Aerial Efficiency

+ Aerial Dominators:

Maguire and Dalot are powerhouses in the air. Maguire leads the squad with an elite 74.68% success rate while winning a massive 3.20 aerial balls per 90.

+ **Target Man:** Sesko acts as the team's primary physical outlet, contesting a squad-high 121 duels. His high volume of 3.51 wins per 90 proves he is an asset in the air.

— **Final-Third Vulnerability:** Mbeumo (16%) and Cunha (37%) struggle significantly in physical, contested aerial situations.

Where The Elite Underperform the Average

Mbeumo is neutralized in physical duels, trailing the Aerial Win baseline by 83.9% marking a major inefficiency. Additionally, his Dribble Success was also below the positional average.

Fernandes struggles very slightly against the average. His dribble success rate sits 22.21% below the positional average, suggesting his strengths lie in the passing department.

Shaw shows minor drop-offs compared to defensive benchmarks. His main focus area is dribbling where his dribble success rate sits 15.03% below the positional average.

The Super-Sub Index

Lack of Depth: Only three players in the squad deliver goal contributions off the bench.

League-Low Production: Only 3 percent of goals scored are from the bench placing 15th in league for goals off the bench.
